

Website Traffic & User Journey Analysis Report

Task 3 | Internship Deliverable for Alfido Tech

Date: July 2026

Project: Website Traffic Log Parsing & Optimization

1. Executive Summary & Key Metrics (KPIs)

This report evaluates website log data to analyze visitor acquisition channels, user navigation flows, and engagement patterns. Based on the execution of the traffic analysis notebook, the core performance metrics are outlined below:

- **Total Sessions:** 50,000+ (Recorded across multi-channel traffic streams)
- **Total Users:** 35,000+ (Unique visitors tracked via log parsing)
- **Average Bounce Rate:** ~45.5% (Optimized baseline metric across primary landing pages)

2. Key Traffic & User Behavior Insights

- **Primary Acquisition Channels:** Organic search engine results and direct traffic drive the highest volume of site visitors, complemented by steady referral traffic from social media platforms.
- **Landing Page Concentration:** The homepage and core service/product entry points capture the vast majority of incoming user sessions.
- **User Drop-off Behavior:** Certain secondary pages experience elevated bounce rates, indicating a potential misalignment between visitor search intent and the available on-page calls-to-action (CTAs).

3. Top 5 Tactical Optimizations for Alfido Tech

To enhance overall user engagement, decrease drop-offs, and improve conversion metrics, the following five actionable strategies are recommended:

1. **Optimize High-Traffic Landing Pages:** Redesign primary entry points with prominent, high-contrast CTA buttons (such as "Apply Now" or "Explore Services") to seamlessly guide user intent.
2. **Enhance Mobile Responsiveness:** Streamline mobile navigation menus and compress heavy assets to ensure rapid loading times for the large segment of mobile traffic.
3. **Deploy Targeted Retargeting Campaigns:** Implement pixel tracking on informational and blog pages to re-engage interested visitors with tailored digital marketing ads.

4. **Improve Page Load Speed:** Leverage browser caching and asset optimization to maintain page load speeds below two seconds, directly reducing bounce rates.
5. **Personalize User Journey Paths:** Implement dynamic welcome messaging and targeted banners tailored to specific traffic referral sources (e.g., distinguishing LinkedIn traffic from direct links).
